

Livestock Services

From reducing system input costs, to implementing a grazing strategy and transferring knowledge from research we can help make your livestock systems more resilient for the future.

As part of SRUC, we can draw on a huge range of knowledge from across the organisation — including farm advisors, vets, and researchers. This means you get support backed by real farm experience, local understanding, and the latest science.

We focus on helping farms become more efficient, more profitable, and better prepared for a changing climate.

Our aim is simple – helping you make the most of your land, livestock, and local resources while producing food for both local and global markets.

We can offer a fresh pair of eyes on your livestock system and give straightforward advice to help improve productivity and profitability.

Our team is well respected across the industry for sharing our technical knowledge, and we are involved in many red-meat supply chain projects, producer groups, and market-focused initiatives.

We work with a wide range of clients — farmers, processors, retailers, industry bodies, social enterprises, research groups, universities, livestock markets, and many more. We keep up with current trends, prices, and industry challenges so that you don't have to.

To explore how we can help your farm business, contact us on livestock@sac.co.uk.

Our services include:

- Independent reviews and system analysis
- Reduced cost systems e.g. low input systems, outwintering, grass management strategies
- Rationing of livestock, bespoke to your ingredients and silage analysis
- Financial appraisal of whole farm systems
- Grassland management systems and computer software
- Mitigation strategies
- Data management and interpretation
- Implementing regenerative or holistic systems
- Training for farm staff and other agricultural businesses
